

a A graph G

G = octahedron, 4-regular;
one of its 38 Eulerian orientations

b The palindromic genome

$S = P_{x_0} \Sigma_1 P_{x_1} \Sigma_2 \cdots$ (circular),
vertices in Eulerian-circuit order

$P_x = u_x \overline{u_x}$, e.g.
AACTGG|CCAGTT, $\rho P_x = P_x$

content $a: P_x \rightarrow P_y$, $\rho a: P_y \rightarrow P_x$,
multiplicity 1: a box point picks
 a or ρa = an orientation of $\{x, y\}$

c Box points = Eulerian orientations
